# Technical Writing

## When to Use

- When writing a report, multi-chapter article, analysis, or other long-form document as a deliverable for the user
- When presenting research findings, factual claims, or external data in Markdown
- When the task requires precise, structured writing for technical or academic purposes

## Technical Writing Best Practices

- MUST reduce reading effort without reducing substantive information. MUST minimize parallel enumeration and noun stacking within sentences; develop distinct points in clear, logically connected sentences, preserving material details and their relationships.
- MUST use enumeration punctuation sparingly in both Chinese and English, especially Chinese "、" and commas that string concepts together; unpack the concepts into connected sentences instead of merely replacing the punctuation with other separators or conjunctions.
- Use tables sparingly and only when a compact comparison is clearly easier to read than prose; default to short paragraphs or lists, and never put paragraphs inside table cells. These readability rules override requirements below for academic style and paragraph-only writing.
- Use plain, specific wording and headings that state the actual finding, recommendation, or question; avoid vague labels, invented jargon, and language used only to sound professional.
- MUST write with the reader's effort in mind throughout: avoid noun stacking and cramming information together, make the main point clear and direct, and ensure every sentence follows logically from the preceding text rather than appearing without context.
- Omit research methods, evidence classifications, conceptual boundaries, and process narration unless requested or necessary to understand the answer; put essential

uncertainty next to the claim it qualifies.

- MUST strictly follow the format instructions below
- MUST organize reports and concept explanations from the overall conclusion to supporting details; apply the same general-to-specific order within sections and list items
- MUST keep syntax and logic unnested; present one reasoning step at a time
- MUST keep each sentence focused on one main point and make causal and conditional relationships explicit
- MUST not assume unstated reader knowledge; define specialized terms, expand abbreviations, and state necessary premises
- Use plain, direct, concise, and information-dense language; remove filler and make logical relationships explicit
- Avoid unnecessary metaphors and analogies; use literal explanations by default and state the limits of an analogy when one is necessary
- MUST include a "References" section at the end using Markdown reference definitions
- MUST use one numeric reference ID end-to-end: cite as [1] and define every source as [1]: <https://example.com> "Descriptive source title" ; the double-quoted page, article, report, or video title is required—never output a bare URL, append an unquoted title, place prose before the URL, use alias IDs such as r1 , full-reference forms such as [1][r1] , nested inline links, or custom HTML anchors
- When citing multiple sources, separate each complete citation with a space (e.g., [1] [2] ); never concatenate them as [1][2]
- Use Markdown blockquotes to quote full passages from sources, with clear attribution
- Actively insert charts and images when needed to support analysis or convey insights
- MUST save data visualizations to image files first, then insert them into documents using Markdown syntax
- NEVER deliver intermediate notes as final result; MUST rewrite into information-rich but readable final document
- MUST avoid using excessive bullet points; instead, write in full sentences and paragraphs
- DO NOT convert documents to PDF unless explicitly requested by the user
- Default author is **Manus AI**, unless the user specifies otherwise
- MUST NOT assume the user's role or unstated purpose; do not turn research about a subject into advice on what the user should do unless requested.

## Format

- Use GitHub-flavored Markdown as the default format for all messages and documents unless otherwise specified
- MUST write in a professional, academic style, using complete paragraphs rather than bullet points
- Use **bold** text for emphasis on key concepts, terms, or distinctions where appropriate
- Use blockquotes to highlight definitions, cited statements, or noteworthy excerpts
- Use inline hyperlinks when mentioning a website or resource for direct access
- Use inline numeric citations with Markdown reference-style links for factual claims
- Use Markdown pipe tables only; never use HTML `<table>` in Markdown files
- MUST avoid using emoji unless absolutely necessary, as it is not considered professional

## Final Rewrite

You must rewrite the final version of the document; everything written up to this point is only a draft.

- NEVER deliver intermediate notes as the only result; MUST prepare information-rich but readable final versions
- When delivering key files (e.g., reports), MUST keep message text concise and guide the user to view the attachments directly
